

**Question 1 continued**

Lined area for writing the answer to Question 1.

Q1

(Total 4 marks)

P 4 0 0 9 4 A 0 3 2 8

2. A particle  $P$  is moving in a straight line with simple harmonic motion. The centre of the oscillation is the fixed point  $C$ , the amplitude of the oscillation is 0.5 m and the time to complete one oscillation is  $\frac{2\pi}{3}$  seconds. The point  $A$  is on the path of  $P$  and 0.2 m from  $C$ .

Find

(a) the magnitude and direction of the acceleration of  $P$  when it passes through  $A$ , **(3)**

(b) the speed of  $P$  when it passes through  $A$ , **(2)**

(c) the time  $P$  takes to move directly from  $C$  to  $A$ . **(3)**

**Question 2 continued**

Lined area for writing the answer to Question 2.

**(Total 8 marks)**

**Q2**

**Question 3 continued**

Lined area for writing answers.

**(Total 10 marks)**

**Q3**

5. Above the Earth's surface, the magnitude of the gravitational force on a particle due to the Earth is inversely proportional to the square of the distance of the particle from the centre of the Earth. The Earth is modelled as a sphere of radius  $R$  and the acceleration due to gravity at the Earth's surface is  $g$ . A particle  $P$  of mass  $m$  is at a height  $x$  above the surface of the Earth.

(a) Show that the magnitude of the gravitational force acting on  $P$  is

$$\frac{mgR^2}{(R+x)^2} \tag{3}$$

A rocket is fired vertically upwards from the surface of the Earth. When the rocket is at height  $2R$  above the surface of the Earth its speed is  $\sqrt{\left(\frac{gR}{2}\right)}$ . You may assume that air resistance can be ignored and that the engine of the rocket is switched off before the rocket reaches height  $R$ .

Modelling the rocket as a particle,

(b) find the speed of the rocket when it was at height  $R$  above the surface of the Earth. (9)

**Question 5 continued**

Handwriting practice area with 25 horizontal lines.

**(Total 12 marks)**

**Q5**

6. A particle  $P$  of mass  $m$  is attached to one end of a light inextensible string of length  $l$ . The other end of the string is attached to a fixed point  $O$ . The particle is hanging in equilibrium at the point  $A$ , vertically below  $O$ , when it is set in motion with a horizontal speed  $\frac{1}{2}\sqrt{11gl}$ . When the string has turned through an angle  $\theta$  and the string is still taut, the tension in the string is  $T$ .

(a) Show that  $T = 3mg\left(\cos\theta + \frac{1}{4}\right)$ . (8)

At the instant when  $P$  reaches the point  $B$ , the string becomes slack. Find

(b) the speed of  $P$  at  $B$ , (3)

(c) the maximum height above  $B$  reached by  $P$  before it starts to fall. (4)

**Question 6 continued**

Lined writing area for question 6, consisting of 30 horizontal lines.

**(Total 15 marks)**

**Q6**

--	--

7.

Diagram **NOT** accurately drawn

**Figure 1**

The shaded region  $R$  is bounded by the curve with equation  $y = \frac{1}{2}x(6-x)$ , the  $x$ -axis and the line  $x=2$ , as shown in Figure 1. The unit of length on both axes is 1 cm. A uniform solid  $P$  is formed by rotating  $R$  through  $360^\circ$  about the  $x$ -axis.

- (a) Show that the centre of mass of  $P$  is, to 3 significant figures, 1.42 cm from its plane face. **(9)**

The uniform solid  $P$  is placed with its plane face on an inclined plane which makes an angle  $\theta$  with the horizontal. Given that the plane is sufficiently rough to prevent  $P$  from sliding and that  $P$  is on the point of toppling when  $\theta = \alpha$ ,

- (b) find the angle  $\alpha$ . **(4)**

Given instead that  $P$  is on the point of sliding down the plane when  $\theta = \beta$  and that the coefficient of friction between  $P$  and the plane is 0.3,

- (c) find the angle  $\beta$ . **(3)**
